Contact us: This invention relates to an improvement in the method of manufacturing sliders used in data storage apparatus such as magnetic disk units. Sliders are the operative part of a read/write head for interacting with a magnetic disk surface in magnetic disk units. Generally, the slider is composed of a substrate and a thick film metal, which are bonded to each other. The substrate is an aluminum or aluminum alloy having a good

tribological characteristic and durability to the sliding movement, which is also an indispensable requirement to obtain a satisfactory performance of the head. The thick film metal is a soft magnetic material having a well balanced magnetic properties for operating a read/write function. The conventional slider fabrication methods, usually using a stamping process, comprise the steps of punching out from a silicon wafer having integrated circuits 82157476af
